| Project Name  | Calculating Family Expenses using Service Now |
| Maximum Marks | 4 Marks                                       |

**Technical Architecture:**

The Deliverable shall include the architectural diagram as below and the information as per the table1 & table 2

**Table-1 : Components & Technologies:**

| S.No | Component | Description | Technology |
|------|-----------|-------------|------------|
|------|-----------|-------------|------------|

|    |                               |                                                                                        |                                                            |
|----|-------------------------------|----------------------------------------------------------------------------------------|------------------------------------------------------------|
| 1. | User Interface                | Web-based forms and lists for entering, viewing and managing family and daily expenses | ServiceNow UI (Forms, Lists, Related Lists)                |
| 2. | Application Logic-1           | Expense data validation, auto-numbering, and table-level processing                    | ServiceNow Table Configuration, Field Attributes           |
| 3. | Application Logic-2           | Automated aggregation of daily expenses into family-level records                      | ServiceNow Business Rules (Serverside scripting)           |
| 4. | Workflow / Relationship Logic | Logical linking of daily expenses with family expenses for consolidated views          | ServiceNow Table Relationships & Related Lists             |
| 5. | Data Source                   | Structured expense data entered by users                                               | ServiceNow Custom Tables (Family Expenses, Daily Expenses) |
| 6. | File Storage                  | Secure storage and management of expense records                                       | ServiceNow Cloud Database                                  |

**Table-2: Application Characteristics:**

| S.No | Characteristics | Description | Technology |
|------|-----------------|-------------|------------|
|------|-----------------|-------------|------------|

|    |                          |                                                                                                                                                                         |                                      |
|----|--------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------|
| 1. | Open-Source Frameworks   | The solution does not rely on open-source frameworks; it is built using native ServiceNow platform features.                                                            | ServiceNow Platform                  |
| 2. | Security Implementations | Role-based access control ensures that only authorized users can create, view, or modify expense records. User actions are logged for accountability                    | ServiceNow Security & Access Control |
| 3. | Scalable Architecture    | The cloud-based ServiceNow architecture supports scalability, allowing the system to handle increasing numbers of users and expense records without performance issues. | ServiceNow Cloud                     |
| 4. | Availability             | The application is accessible at all times through the ServiceNow instance, enabling continuous expense tracking and review.                                            | ServiceNow Platform                  |
| 5. | Performance              | Optimized form loading and efficient business rule execution ensure smooth performance even as data volume grows.                                                       | ServiceNow Platform                  |
